# Chapter 14

## Recursion

# how to approach recursion?

1. **Strategy:**
  - Rewrite the problem definition in a recursive way..
2. **Header:**
  - What info needed as input and output?
  - Write the function header.
  - Use a noun phrase for the function name
3. **Spec:**
  - Write a method specification in terms of the parameters and return value.
  - Include preconditions
4. **Base cases:**
  1. When is the answer so simple that we know it without recursing?
  2. What is the answer in these base cases(s)?
  3. Write code for the base case(s)
5. **Recursive Cases:**
  1. Describe the answer in the other case(s) in terms of the answer on smaller inputs
  2. Simplify if possible
  3. Write code for the recursive case(s)

# Factorial using Recursion

$$N! = 1 * 2 * \dots * N$$

```
int Factorial(int n) {
    int Product = 1,
        Scan    = 2;

    while ( Scan <= n ) {
        Product = Product * Scan ;
        Scan = Scan + 1 ;
    }
    return (Product) ;
}
```

# Factorial using Recursion

$$N! = 1 * 2 * \dots * N$$

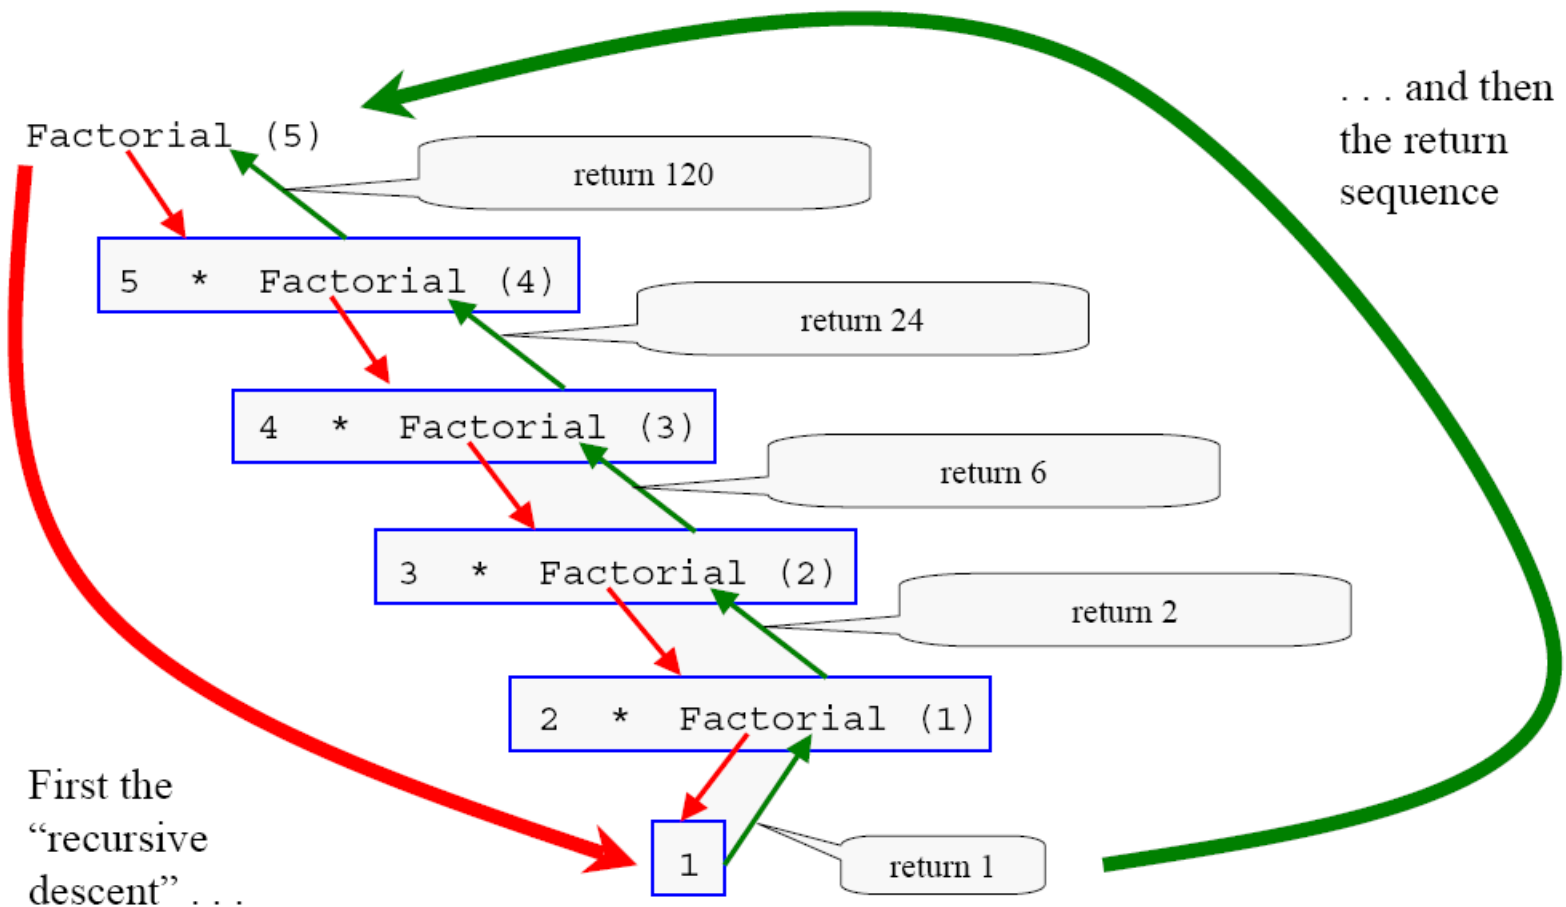

```
int Factorial(int n) {
    int Product = 1,
        Scan    = 2;

    while ( Scan <= n ) {
        Product = Product * Scan ;
        Scan = Scan + 1 ;
    }
    return (Product) ;
}
```

```
int Factorial(int n ) {
    if ( n > 1 )
        return( n * Factorial (n-1) );
    else
        return(1);
}
```

# Factorial using Recursion

$$N! = 1 * 2 * \dots * N$$

# Binary Search

- Our algorithm is basically:
  - Look at the item in the middle
    - If it is the number we are looking for, we are done
    - If it is greater than the number we are looking for, look in the first half of the list
    - If it is less than the number we are looking for, look in the second half of the list

**Display 14.7**

# Binary Search

## An Iterative Version

**Display 14.7**

**Display 14.8**

# Binary Search

## Recursive Version

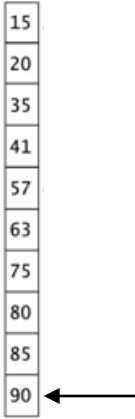

- Since searching each of the shorter lists is a smaller version of the task we are working on, a recursive approach is natural

**Display 14.8**

# Binary Search Recursive Version

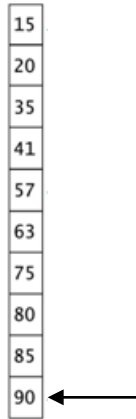

Key = 63

```
void search(const int a[], int first, int last,  
           int key, bool& found, int& location)  
{  
    int mid;  
    if (first > last)  
    {  
        found = false;  
    }  
    else  
    {  
        mid = (first + last)/2;  
  
        if (key == a[mid])  
        {  
            found = true;  
            location = mid;  
        }  
        else if (key < a[mid])  
        {  
            search(a, first, mid - 1, key, found, location);  
        }  
        else if (key > a[mid])  
        {  
            search(a, mid + 1, last, key, found, location);  
        }  
    }  
}
```

Key = 63

```
void search(const int a[], int first, int last,  
           int key, bool& found, int& location)  
{  
    int mid;  
    if (first > last)  
    {  
        found = false;  
    }  
    else  
    {  
        mid = (first + last)/2;  
  
        if (key == a[mid])  
        {  
            found = true;  
            location = mid;  
        }  
        else if (key < a[mid])  
        {  
            search(a, first, mid - 1, key, found, location);  
        }  
        else if (key > a[mid])  
        {  
            search(a, mid + 1, last, key, found, location);  
        }  
    }  
}
```

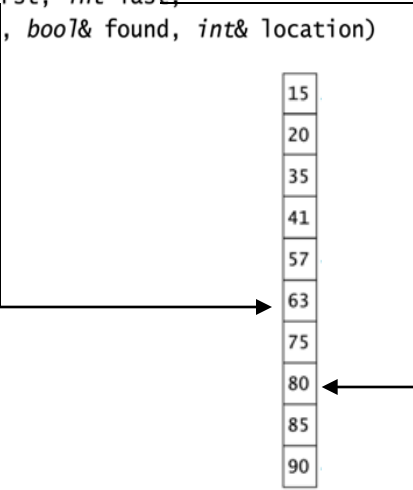

# Binary Search

## Recursive Version

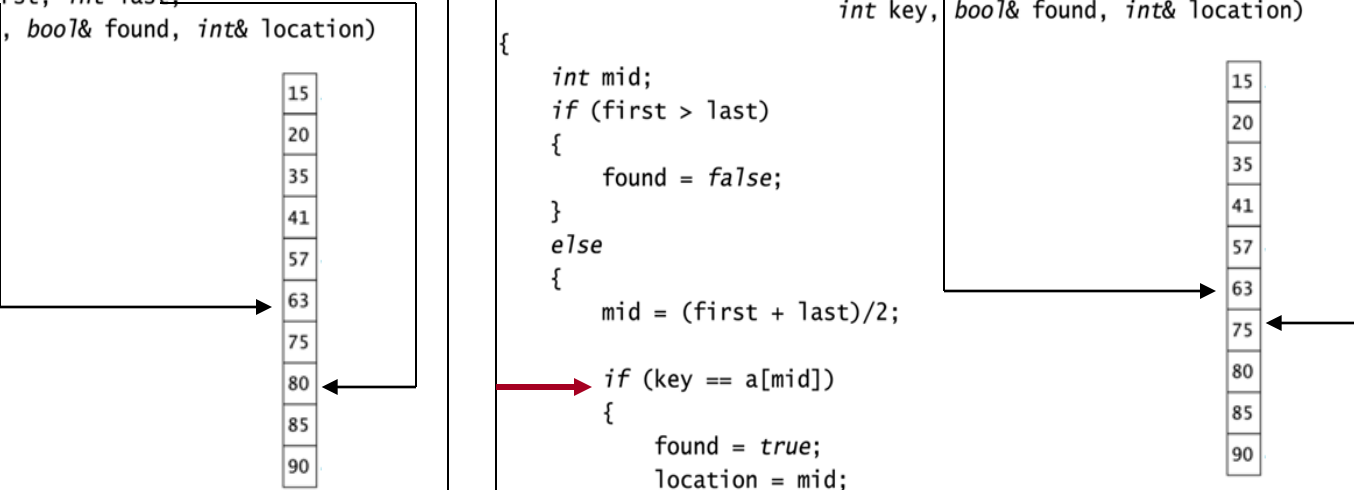

Key = 63

```
void search(const int a[], int first, int last,  
           int key, bool& found, int& location)  
{  
    int mid;  
    if (first > last)  
    {  
        found = false;  
    }  
    else  
    {  
        mid = (first + last)/2;  
  
        if (key == a[mid])  
        {  
            found = true;  
            location = mid;  
        }  
        else if (key < a[mid])  
        {  
            search(a, first, mid - 1, key, found, location);  
        }  
        else if (key > a[mid])  
        {  
            search(a, mid + 1, last, key, found, location);  
        }  
    }  
}
```

Key = 63

```
void search(const int a[], int first, int last,  
           int key, bool& found, int& location)  
{  
    int mid;  
    if (first > last)  
    {  
        found = false;  
    }  
    else  
    {  
        mid = (first + last)/2;  
  
        if (key == a[mid])  
        {  
            found = true;  
            location = mid;  
        }  
        else if (key < a[mid])  
        {  
            search(a, first, mid - 1, key, found, location);  
        }  
        else if (key > a[mid])  
        {  
            search(a, mid + 1, last, key, found, location);  
        }  
    }  
}
```

# Binary Search

## Recursive Version – pseudo code

- Here is our first refinement:

```
found = false;
mid = approx. midpoint between first and last;
if (key == a[mid])
{
    found = true;
    location = mid;
}
else if (key < a[mid])
    search a[first] through a[mid - 1]
else if (key > a[mid])
    search a[mid + 1] through a[last];
```

# Binary Search

## Recursive Version – pseudocode

- We must ensure that our algorithm ends
  - If key is found in the array, there is no recursive call and the process terminates
  - What if key is not found in the array?
    - At each recursive call, either the value of first is increased or the value of last is decreased
    - If first ever becomes larger than last, we know that there are no more indices to check and key is not in the array
- The final pseudocode is shown in

**Display 14.5**

# Binary Search

## Writing the Code

- Function search implements the algorithm:

- Function search interface:

```
void search(const int a[ ], int first, int last,  
           int key, bool& found, int& location);  
//precondition: a[0] through a[final_index] are  
//              sorted in increasing order  
  
//postcondition: if key is not in a[0] - a[final_index]  
//              found == false; otherwise  
//              found == true
```

**Display 14.6 (1)**

**Display 14.6 (2)**

# Binary Search

## Checking the Recursion

- There is no infinite recursion
  - On each recursive call, the value of first is increased or the value of last is decreased. Eventually, if nothing else stops the recursion, the stopping case of  $\text{first} > \text{last}$  will be called

# Binary Search

## Checking the Recursion (cont.)

- Each stopping case performs the correct action
  - If  $\text{first} > \text{last}$ , there are no elements between  $a[\text{first}]$  and  $a[\text{last}]$  so key is not in this segment and it is correct to set found to false
  - If  $k == a[\text{mid}]$ , the algorithm correctly sets found to true and location equal to mid
  - Therefore both stopping cases are correct

# Binary Search

## Checking the Recursion (cont.)

- For each case that involves recursion, if all recursive calls perform their actions correctly, then the entire case performs correctly  
Since the array is sorted...
  - If  $\text{key} < a[\text{mid}]$ , key is in one of elements  $a[\text{first}]$  through  $a[\text{mid}-1]$  if it is in the array. No other elements must be searched...the recursive call is correct
  - If  $\text{key} > a[\text{mid}]$ , key is in one of elements  $a[\text{mid}+1]$  through  $a[\text{last}]$  if it is in the array. No other elements must be searched... the recursive call is correct

# Display 14.5

## Pseudocode for Binary Search

---

```
int a[Some_Size_Value];
```

**Algorithm to search** a[first] **through** a[last]

```
//Precondition:
```

```
//a[first] <= a[first + 1] <= a[first + 2] <= ... <= a[last]
```

To locate the value key:

```
if (first > last) //A stopping case
```

```
    found = false;
```

```
else
```

```
{
```

```
    mid = approximate midpoint between first and last;
```

```
    if (key == a[mid]) //A stopping case
```

```
    {
```

```
        found = true;
```

```
        location = mid;
```

```
    }
```

```
    else if key < a[mid] //A case with recursion  
        search a[first] through a[mid - 1];
```

```
    else if key > a[mid] //A case with recursion  
        search a[mid + 1] through a[last];
```

```
}
```

---

# Display 14.6 (1/2)

## Recursive Function for Binary Search (part 1 of 2)

---

```
//Program to demonstrate the recursive function for binary search.
#include <iostream>
using namespace std;
const int ARRAY_SIZE = 10;

void search(const int a[], int first, int last,
            int key, bool& found, int& location);
//Precondition: a[first] through a[last] are sorted in increasing order.
//Postcondition: if key is not one of the values a[first] through a[last],
//then found == false; otherwise, a[location] == key and found == true.

int main()
{
    int a[ARRAY_SIZE];
    const int final_index = ARRAY_SIZE - 1;

    <This portion of the program contains some code to fill and sort
        the array a. The exact details are irrelevant to this example.>

    int key, location;
    bool found;
    cout << "Enter number to be located: ";
    cin >> key;
    search(a, 0, final_index, key, found, location);

    if (found)
        cout << key << " is in index location "
            << location << endl;
    else
        cout << key << " is not in the array." << endl;

    return 0;
}
```

---

# Display 14.6

## (2/2)

### Recursive Function for Binary Search (part 2 of 2)

---

```
void search(const int a[], int first, int last,
            int key, bool& found, int& location)
{
    int mid;
    if (first > last)
    {
        found = false;
    }
    else
    {
        mid = (first + last)/2;

        if (key == a[mid])
        {
            found = true;
            location = mid;
        }
        else if (key < a[mid])
        {
            search(a, first, mid - 1, key, found, location);
        }
        else if (key > a[mid])
        {
            search(a, mid + 1, last, key, found, location);
        }
    }
}
```

---

## Execution of the Function search

key is 63

a[0]	15	← first == 0
a[1]	20	
a[2]	35	
a[3]	41	
a[4]	57	← mid = (0 + 9)/2
a[5]	63	
a[6]	75	
a[7]	80	
a[8]	85	
a[9]	90	← last == 9

a[0]	15	
a[1]	20	
a[2]	35	← Not in this half
a[3]	41	
a[4]	57	
a[5]	63	← first == 5
a[6]	75	
a[7]	80	← mid = (5 + 9)/2
a[8]	85	
a[9]	90	← last == 9

a[0]	15	
a[1]	20	
a[2]	35	
a[3]	41	
a[4]	57	
a[5]	63	← first == 5
a[6]	75	← last == 6
a[7]	80	
a[8]	85	
a[9]	90	

mid = (5 + 6)/2 which is 5  
a[mid] is a[5] == 63  
found = true;  
location = mid;

# Display 14.7

## Iterative Version of Binary Search

---

### Function Declaration

```
void search(const int a[], int low_end, int high_end,
            int key, bool& found, int& location);
//Precondition: a[low_end] through a[high_end] are sorted in increasing
//order.
//Postcondition: If key is not one of the values a[low_end] through
//a[high_end], then found == false; otherwise, a[location] == key and
//found == true.
```

### Function Definition

```
void search(const int a[], int low_end, int high_end,
            int key, bool& found, int& location)
{
    int first = low_end;
    int last = high_end;
    int mid;

    found = false; //so far
    while ( (first <= last) && !(found) )
    {
        mid = (first + last)/2;
        if (key == a[mid])
        {
            found = true;
            location = mid;
        }
        else if (key < a[mid])
        {
            last = mid - 1;
        }
        else if (key > a[mid])
        {
            first = mid + 1;
        }
    }
}
```

---
