Revision

## Retuning largest value in an array

- Pseudo-code?
- Assume first element is the largest
- Visit all elements starting from second and do the following
- if it is larger than the largest
- Set largest to it.

## Retuning largest value in an array

int returnLargestNumber( const int narrInput] , int nSize )
\{
int nIndex,nLargest;
if( nSize == 0 ) return -9999999;
nLargest $=$ narrInput[0];
for( nIndex = 1; nIndex < nSize; nIndex = nIndex + 1 )
if( narrInput[nIndex] > nLargest )
nLargest = narrInput[nIndex];
return nLargest;

# Finding largest value in an array (using recursion) 

- Pseudo-code?
base condition: we are done with the array no more elements to visit? When is that? Some index variable is $==$ to array size
recursive case:
compare current element against largest and call function recursively

# Finding largest value in an array (using recursion) 

int returnLargestNumber( const int narrInput[], int nSize , int\& nIndex )
\{
// Can you write this?
\}

# Given an array, replace all occurrences of a value with another 

- Pseudo-code?
- Visit all elements starting from first and do the following
- if it is the value we are looking for then
- Change it to the new value

## Given an array, replace all occurrences of a value with another

void replaceNumber( int narrInput[] , int nSize, int nOld, int nNew )
\{
int nIndex;
for ( nIndex = 0; nIndex < nSize; nIndex = nIndex + 1 )
if( narrInput[nIndex] == nOld )
narrInput[nIndex] = nNew;
\}

## Given an array, replace all occurrences of a value with another (using pointers)

void replaceNumber( int narrInput[] , int nSize, int nOld, int nNew )
\{
int *nptrVal;
for( nptrVal = \&narrInput[0]; nptrVal <= \&narrInput[nSize-1] ; nptrVal $=$ nptrVal +1 )

$$
\begin{aligned}
& \text { if( *nptrVal }==\text { nOld }) \\
& \text { *nptrVal }=\text { nNew; }
\end{aligned}
$$

\}

# Given an array of characters, change all lowercase to uppercase 

- Given: Ascii of a is 97 while Ascii of $A$ is $65, \ldots$.

Ascii of $z$ is 122 while Ascii of $Z$ is 90

| Dec | char |  | Dec | chr | Dec | Chr | Dec | Chr |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | NUL | (null) | 32 | space | 64 | [10 | 96 |  |
| 1 | SOH | (start of heading) | 33 |  | 65 | A | 97 | a |

| 30 | RS | (record separator) | 62 | $>$ | 94 |  | 126 | $\sim$ |
| 31 | US | (unit separator) | 63 | $?$ | 95 | - | 127 | DEL |

# Given an array of characters, change all lowercase to uppercase 

- Pseudo-code?

Visit every character
if it is a small letter (i.e. ascii between 97 and 22) subtract 32 from the ascii value

## Given an array of characters, change all lowercase to uppercase

void changetoUpperCase( char carrInput[])
int nIndex;
int nChar;
nIndex = 0;
while( carrInput[nIndex] != 'IO' )
\{
nChar = carrInput[nIndex];
if( nChar >= 97 \&\& nChar <= 122 )
carrInput[nIndex] = carrInput[nIndex] -32;
nIndex = nIndex + 1;
if( nChar >= 97 \&\& nChar <= 122 )
carrInput[nIndex] = carrInput[nIndex] - 32;

## Note: <br> This function assumes that the passed char array ends with ' 10 ', so we loop till we hit it

\}

## Additional Exercises

- Write a function that calculates Fibonacci value recursively

$$
F_{n}= \begin{cases}0 & \text { if } n=0 \\ 1 & \text { if } n=1 \\ F_{n-1}+F_{n-2} & \text { if } n>1\end{cases}
$$

- Write a function that multiply two matrices. Each matrix is represented as a 2D array.
- Rewrite the binary search using pointers instead of indices
